

Imme Product Information

imme™ is CycurlD's consumer centric privacy and identity app. It is a proprietary, secure, closed loop and encrypted identity verification and privacy app which makes it possible for consumers to set up a social profile, manage crypto funds or transact online without sharing any, or minimal, amounts of personal information.

Powered by technologies such as liveness detection and facial AI recognition, imme™ is able to verify users' identity once without storing their information on third-party servers. The verification process removes the potential for data leaks and identity theft by authenticating user ID without sharing it with third parties or using manual review processes, keeping it in consumers' control while giving businesses the verification they require.

Once verified, users can access online accounts by scanning a QR code with the imme™ app, instead of using a password, uploading their documents or transacting with a credit card number.
